### Standard Features

HP Entry-Level Power Supplies provide lower-cost options for customers trying to balance their need for enterprise class efficiency and reliability while maintaining lowest possible hardware costs. All Entry-Level power supply options have been designed specifically for HP ProLiant Gen9 Essential Series servers.

The HP 550W FIO Power Supply is the standard, non-redundant AC power supply option for most HP ProLiant Gen9 Essential servers. It features Silver-level (89%) certified power efficiency with a set of features optimized for the Gen9 Essential-series rack and tower servers.

The HP 800W Gold (Redundant)/900W (Non-Redundant) AC Power Input Module with Power Backplane can be configured to support power redundancy in ProLiant servers that offer only a single power supply bay, providing additional protection against power loss. With an 80 Plus Gold power efficiency rating (up to 92%), this power option helps to reduce operating expenses while protecting against trapped power capacity in the data center. Each power backplane option can support up to two (2) hot-plug AC power input modules.

All pre-configured servers ship with a standard 6-foot IEC C-13/C-14 jumper cord (A0K02A). This jumper cord is also included with each standard AC power supply option kit. If a different power cord is required, please check the [ProLiant Power Cables](#) web page.

To review the power requirements for your selected system, please use the HP Power Advisor Tool located at <http://www.hp.com/go/hppoweradvisor>.

Power specifications and technical content for all HP Server power supplies can be found at <http://www.hp.com/go/proliant/powersupply>.

BitLocker leverages the enhanced security capabilities of a Trusted Platform Module (TPM) version 1.2. The TPM works with BitLocker to help protect user data and to ensure that a server running Windows Server 2008 has not been tampered with while the system was offline. For more information about TPM, including a white paper, go to: <a href="http://www.hp.com/go/TPM">http://www.hp.com/go/TPM</a> .	
	<b>NOTE:</b> ProLiant OS pre-installed units will come with the partition required for TPM deployment.

Memory

**Memory Subsystem Architecture** Each Intel® Xeon® E5-2600v3 family processor socket contains four memory channels per installed processor with two DIMMs per channel for a total of eight (8) DIMMs or a grand total of sixteen (16) DIMMs for the server.

Memory Population guidelines

- General Memory Population Rules and Guidelines:**
- Install DIMMs only if the corresponding processor is installed.
  - If only one processor is installed in a two processor system, only half of the DIMM slots are available.
  - To maximize performance, it is recommended to balance the total memory capacity between all installed processors and load the channels similarly whenever possible.
  - When two processors are installed, balance the DIMMs across the two processors.
  - White DIMM slots denote the first slot to be populated in a channel.
  - Place the DIMMs with the highest number of ranks in the white slot when mixing DIMMs of different ranks on the same channel.
  - Do not mix RDIMMs or LRDIMMs.
  - Quad rank RDIMMs are not supported in HP ProLiant DL180 Gen9 servers.
  - Quad rank LRDIMMs are capable of up to two DIMMs per channel.
  - DIMMs of different speeds may be mixed in any order; the server will select a common optimal speed.
  - The maximum memory speed is a function of the memory type, memory configuration, and processor model.
  - The maximum memory capacity is a function of the memory type and number of installed processors.
  - To realize the performance memory capabilities listed in this document, HP SmartMemory is required.
